

Introduction

1. Introduction

There are Two Actors is Available in Our Application:

1. Admin
2. User

The system is developed for provide electricity service to customers. It maintains the customer with what plans they should go with as per their power usage. This is for both residential and commercial. This is an overseas client, we have two actors on portal i.e., User and Admin. The web application using Asp.NET 4.5 SQL Server 2019, Bootstrap, Kendo Controls, JavaScript and jQuery.

1.1 Existing System

No existing system, fresh requirement from client.

1.2 Objective of the system

The main objective of the electricity service is to manage the details of Electricity Power, Light Bill, Payments, Power Usage, Charges and etc. It manages all the information about Electricity Usage, Electricity Hub and this project is totally built at administrative end and thus only the administrator is guaranteed the access. The purpose of the project is to build an application program to reduce the manual work for managing the Light Bill, Electricity Plan, Payments and etc. It tracks all the details about Power Usage.

1.3 Problem Definition

The purpose of website is established fact that Internet users are increasing today. One of the main purposes of the website is to facilitate the offline customer online because customers cannot spend their precious time in markets trying to find out the best deal. The problem is that we although having many websites but they offer different kind of services. The customers are enjoying a lot but there is a lack of relationship between Electricity Hub and customers and hence we are establishing that relationship by caring and serving all customers in the same manner that we wish to be served.

1.4 Core Components

App components are the essential building blocks of an Android app. Each component is an entry point through which the system or a user can enter your app. Some components depend on others. Each type serves a distinct purpose and has a distinct lifecycle that defines how the component is created and destroyed. The following sections describe the four types of app components.

Hardware Component

- Intel Quad core 1.7 GHZ Processor or above.
- Minimum 100 GB HD.
- Standard Keyboard and Serial Mouse.
- Minimum 4GB Of Ram

Software Component

- **Operating System:** Windows 10
- Visual Studio 2019
- SQL Server 2019

1.5 Project Profile

| | |
|-------------------------------|---|
| Project Title | : Electricity Hub |
| Internal Project Guide | : Mr. Pratik Patel |
| External Project Guide | : Mr. Parth Panchal, Mr. Mayur Shah |
| Team Size | : 3 persons (Three persons) |
| Team Member | : Abhishek Tripathi, Harsh Roy, Vaidik Kanani |
| Front End | : Asp.Net 4.5 |
| Back End | : SQL Server 2019 |
| Project Duration | : 4 Months(approx.) |
| Starting Date | : 24 th January, 2023 |
| Ending Date | : 23 rd May, 2023 |

1.6 Assumptions and constraints

Assumptions:

- Electricity Hub is web application so all user can easily access services like Power Usage, Pay Bill etc.
- User and Admin first need to login in the system.
- All the users must have an internet enabled devices.
- User can add new connection from electricity we can choice any plan from home

Constraints:

- Users have compulsory knowledge about English language.

1.7 Advantages of the Proposed System

- Electricity hub is developed to save precious time of customers.
- Electricity hub will help today's generation to make their electricity services easy and faster.
- Electricity hub web application has does not need to install in particular computer or any other system, it need only internet connectivity.

1.8 Limitations of the Proposed System

- Electricity hub will show the monthly power usage of customer.
- This hub will only work on the provided limited area.
- The hub has the limitations for users that they can only use and see only their account details and they can only access data of their account.

Requirement Determination & Analysis

2. Requirement Determination & Analysis

A software requirements specification (SRS) is a description of a software system to be developed. It lays out functional and non-functional requirements and may include a set of use cases that describe user interactions that the software must provide.

Software requirements specification establishes the basis for an agreement between customers and admin or government (in market-driven project, these roles may be played by the marketing and development divisions) on what the software product is to do as well as what it is not expected to do. Software requirements specification permits a rigorous assessment of requirements before design can begin and reduces later redesign. It should also provide a realistic basis for estimating product costs, risks, and schedules. Used appropriately, software requirements specifications can help prevent software project failure.

The software requirements specification document enlists enough and necessary requirements that are required for the project development. To derive the requirements, the developer needs to have clear and thorough understanding of the products to be developed or being developed. This is achieved and refined with detailed and continuous communications with the project team and customer till the completion of the software.

2.1 Requirement Determination

The process to gather the software requirements from clients, analyzing and documentation them is known as requirement engineering. The goal of requirement engineering is to develop and maintain sophisticated and descriptive. System Requirements Specification“ document. A software requirements definition is an abstract description of the services which the system should provide and the constraints under which the system must operate. System requirements may be either functional or non-functional requirements. There are three types of major problems with requirements definitions written in natural language:

1. Lack of clarity
 2. Requirements confusion
 3. Requirements amalgamation
- The First sentence in this requirement mixes up three different kinds of requirements:
 1. A Conceptual, functional requirement states that the editing system should provide a grid.
 2. A non-functional requirement giving detailed information about the grid units.
 3. A non-functional user interface requirement which defines how that grid is switched on and off by the user.

2.1.1 Functional Requirement

User:

- In the Whole application the user performs most important role.
- User should be anyone from civilians.
- User can perform all function related their role.
- User have some limited access on the application.

Admin:

- Admin is main part of our Web Application.
- Admin have access to add any needed details of all users.
- Admin will manage the users.
- Admin can update the database of the application.
- Admin have all the access in application.

2.1.2 Non-Functional Requirements

Security:

- Separate login will be provided for the Admin, User. The real estate and inspector will not be given access to the database. All the Admin and User will have different access rights.

Reliability:

- The System must be reliable to prevent any unauthorized access.

Availability:

- Facility to keep constant track of database, admission requests etc. will provided.

Compatibility:

- Since the system would be built on a **.NET** platform it would be compatible with Android computable Devices.

Interoperability:

- The basic high-level design of the system will ensure interoperability as it is based on android platform, also it will facilitate with industry standards.

2.2 Targeted User

The software requirements are description of features and functionalities of the target system. Requirements convey the expectations of Targeted users from the software product. The requirements can be obvious or hidden, known or unknown, expected or unexpected from client's point of view. So, this are the targeted user with their requirement.

❖ Admin Requirement is as follow.

- Process Customer
- Add Channel
 - Add Update Channel
- Add Rate
 - Add Update Rate
- Customer List
- Channel List
- Failed Customer
- Referral Customer List
- Add User
- Landlord List
- Transaction List
- Customer Portal Account

❖ User Requirement is as follow.

- Add New Connection
- View Usage
- View Bill
- View Personal Details
- Change Password

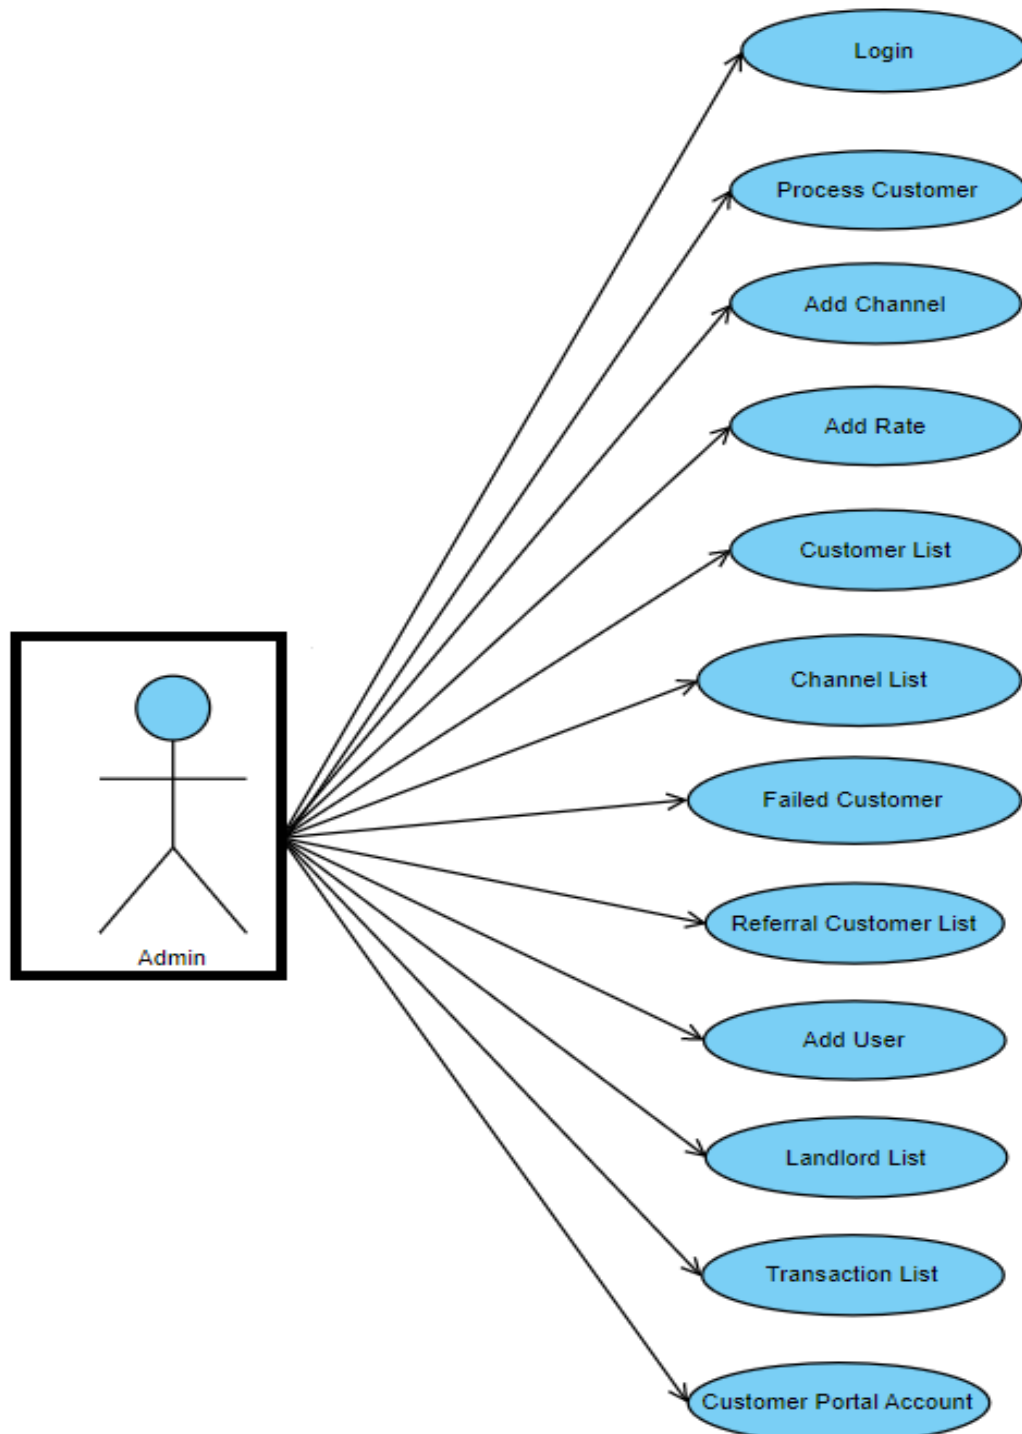

System Design

3.System Design

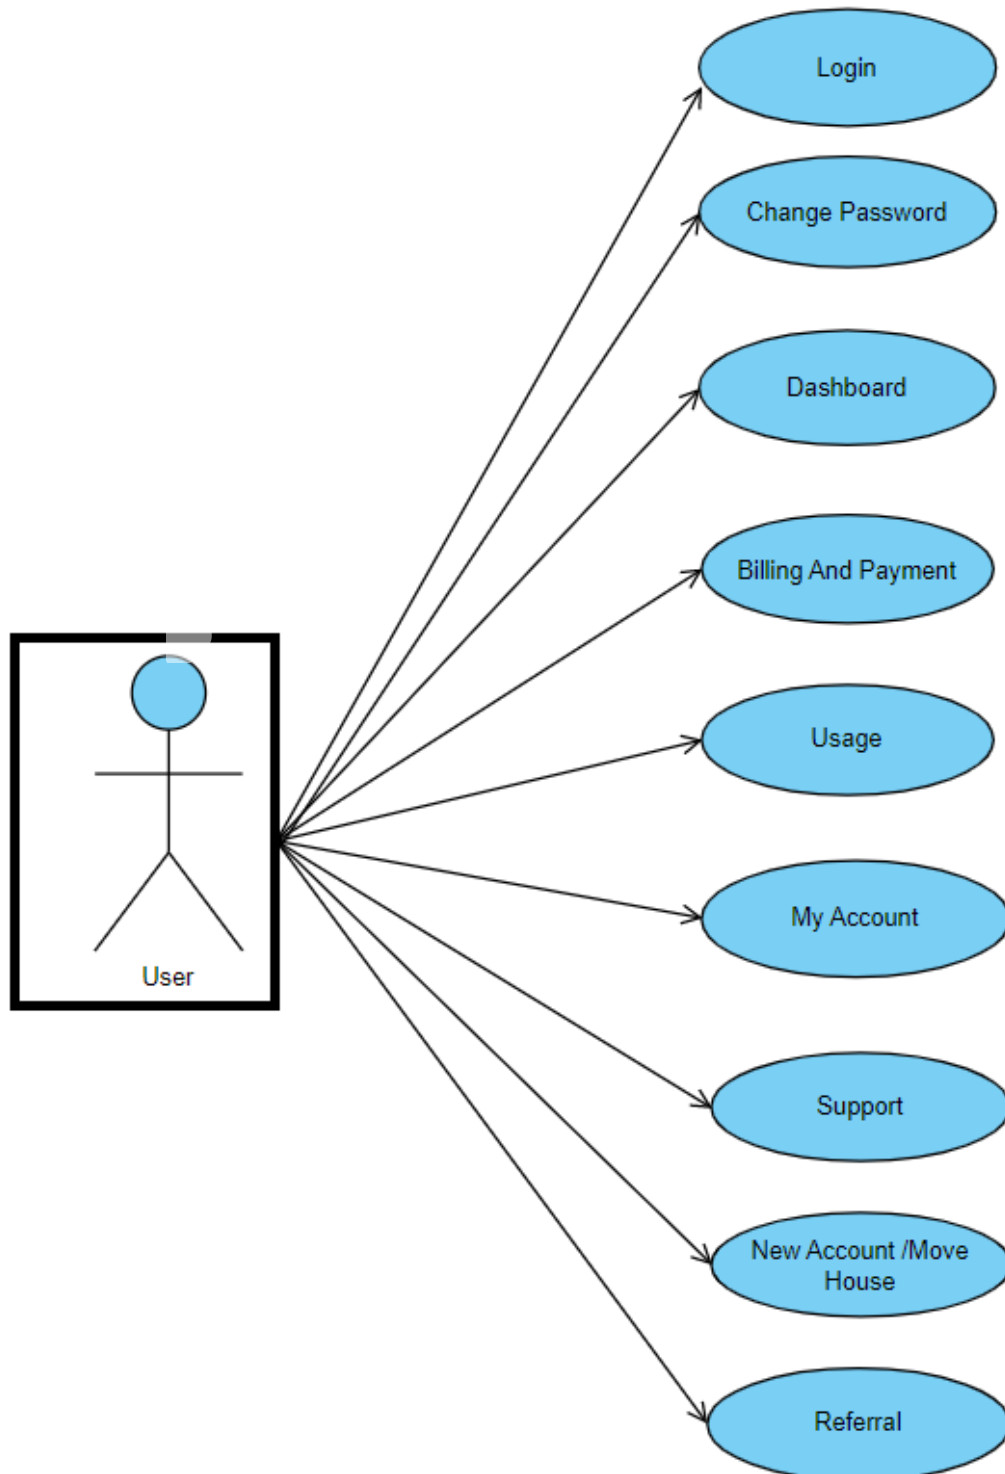

3.1 Use Case Diagram

A use case diagram at its simplest is a representation of a user's interaction with the system that shows the relationship between the user and the different use cases in which the user is involved.

3.1.1 Use Case for Admin

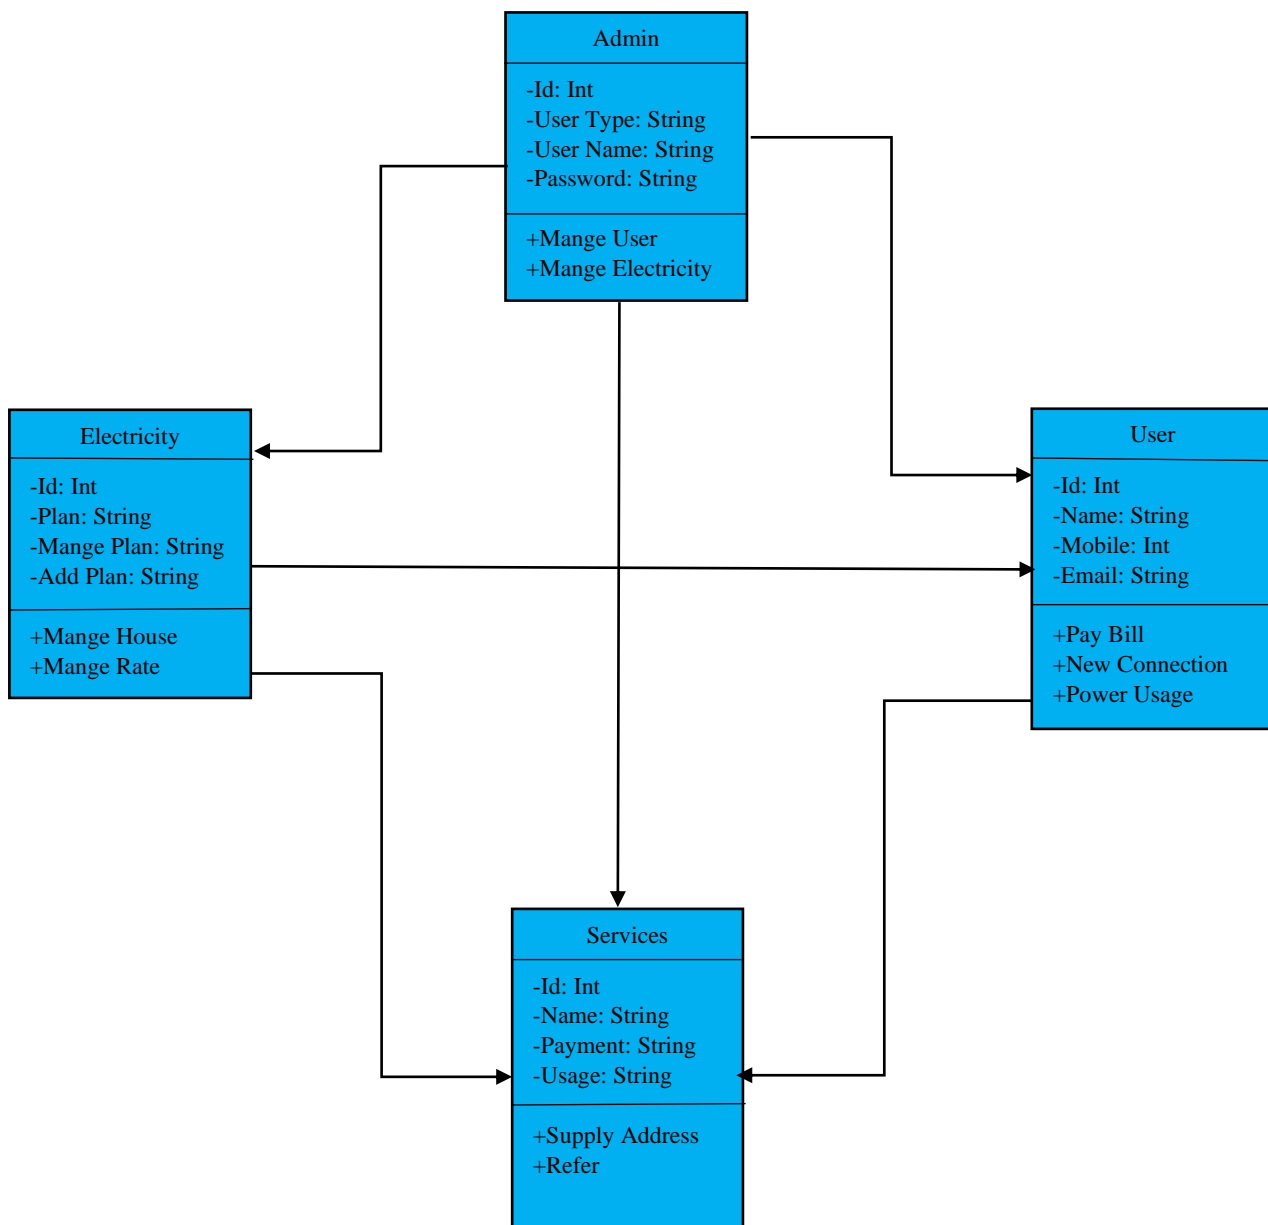

3.1.1 Use Case for User

3.2 Class Diagram

In software engineering, a **Class Diagram** in the Unified Modeling Language (UML) is a type of static structure diagram that describes the structure of a system by showing the system's classes, their attributes, operations (or methods), and the relationships among objects.

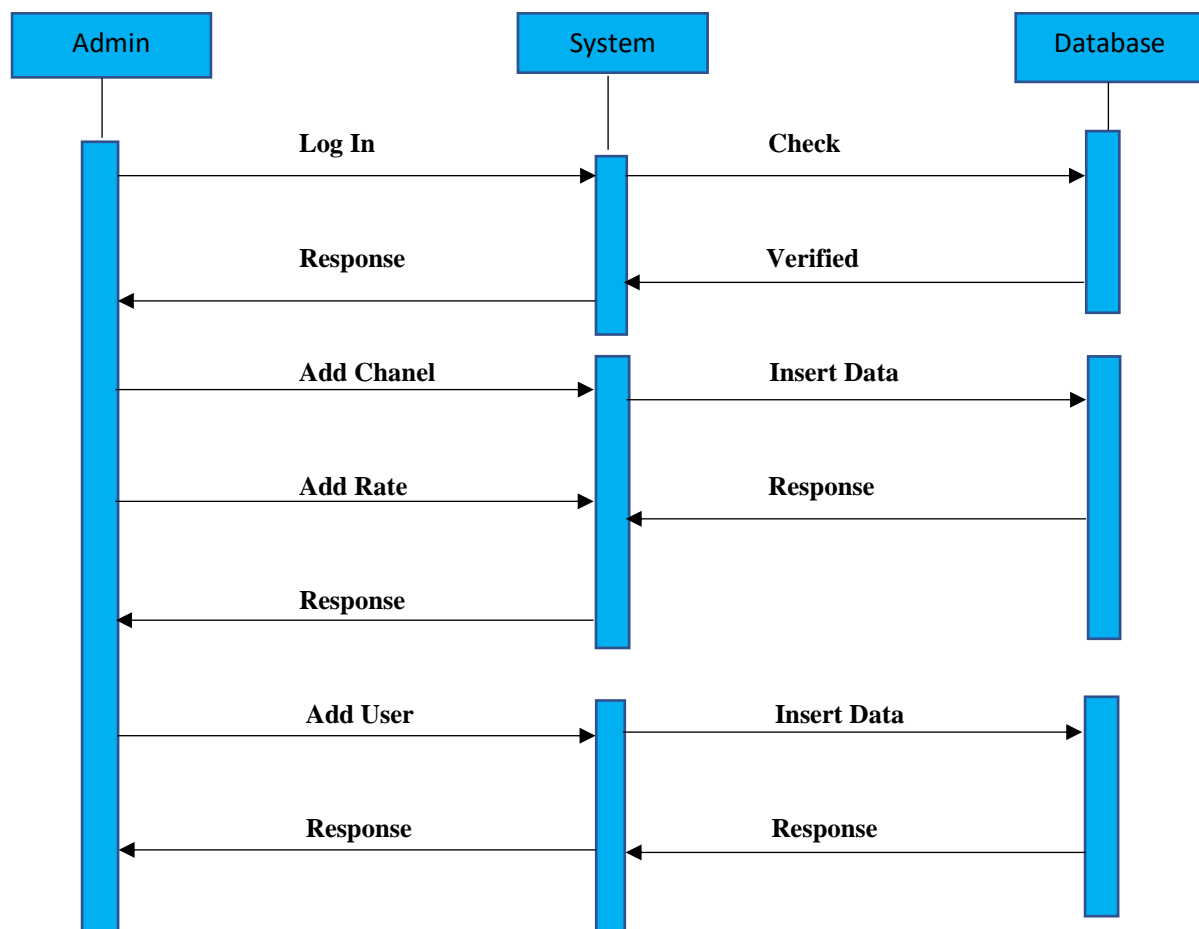

The class diagram is the main building block of object-oriented modeling. It is used for general conceptual modeling of the systematic of the application, and for detailed modeling translating the models into programming code. Class diagrams can also be used for data modeling. The classes in a class diagram represent both the main elements, interactions in the application, and the classes to be programmed.

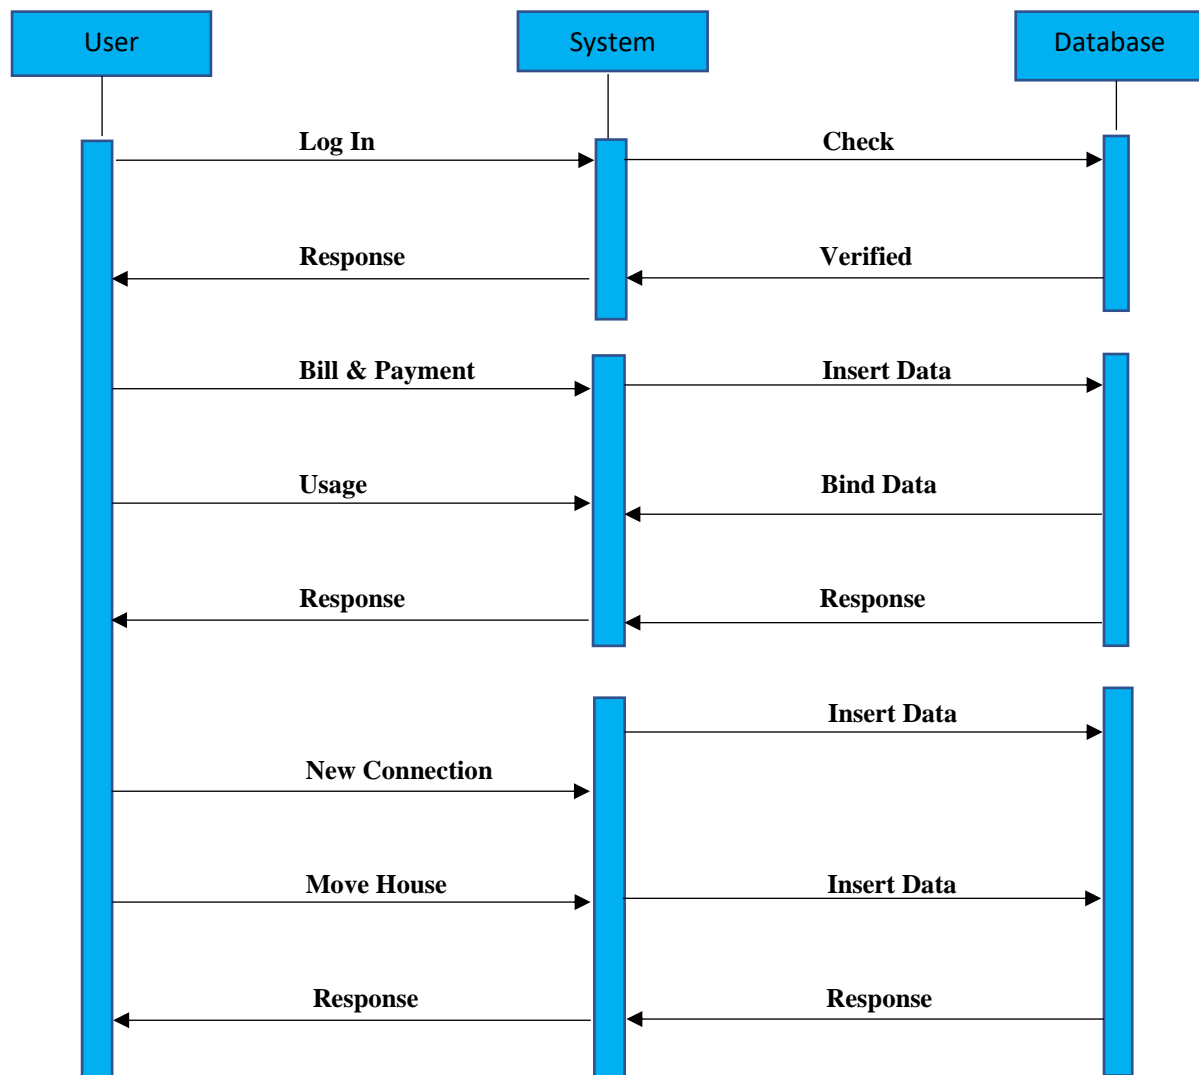

3.3 Interaction Diagram

An interaction diagram shows object interactions arranged in time sequence. It depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario. Sequence diagrams are typically associated with use case realizations in the Logical View of the system under development. Sequence diagrams are sometimes called event diagrams or event scenarios.

Interaction Diagram for Admin

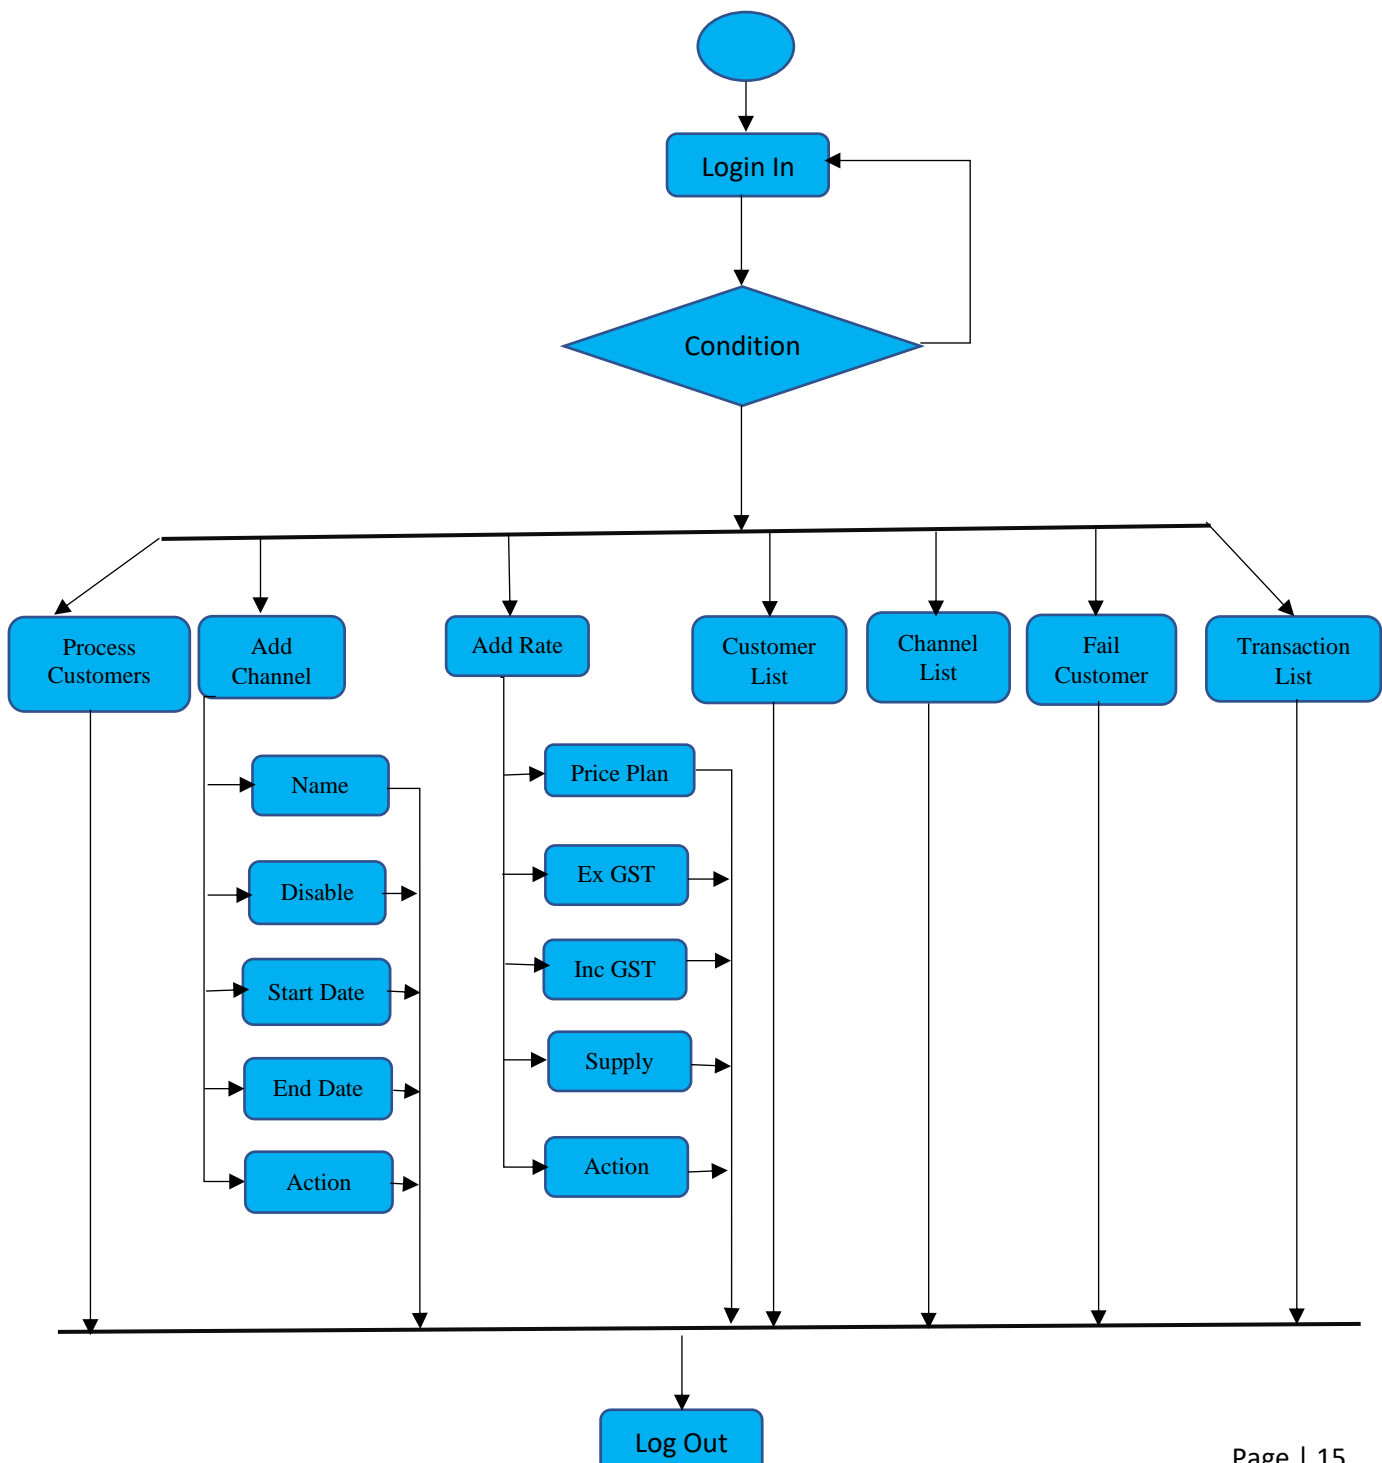

Interaction Diagram for User

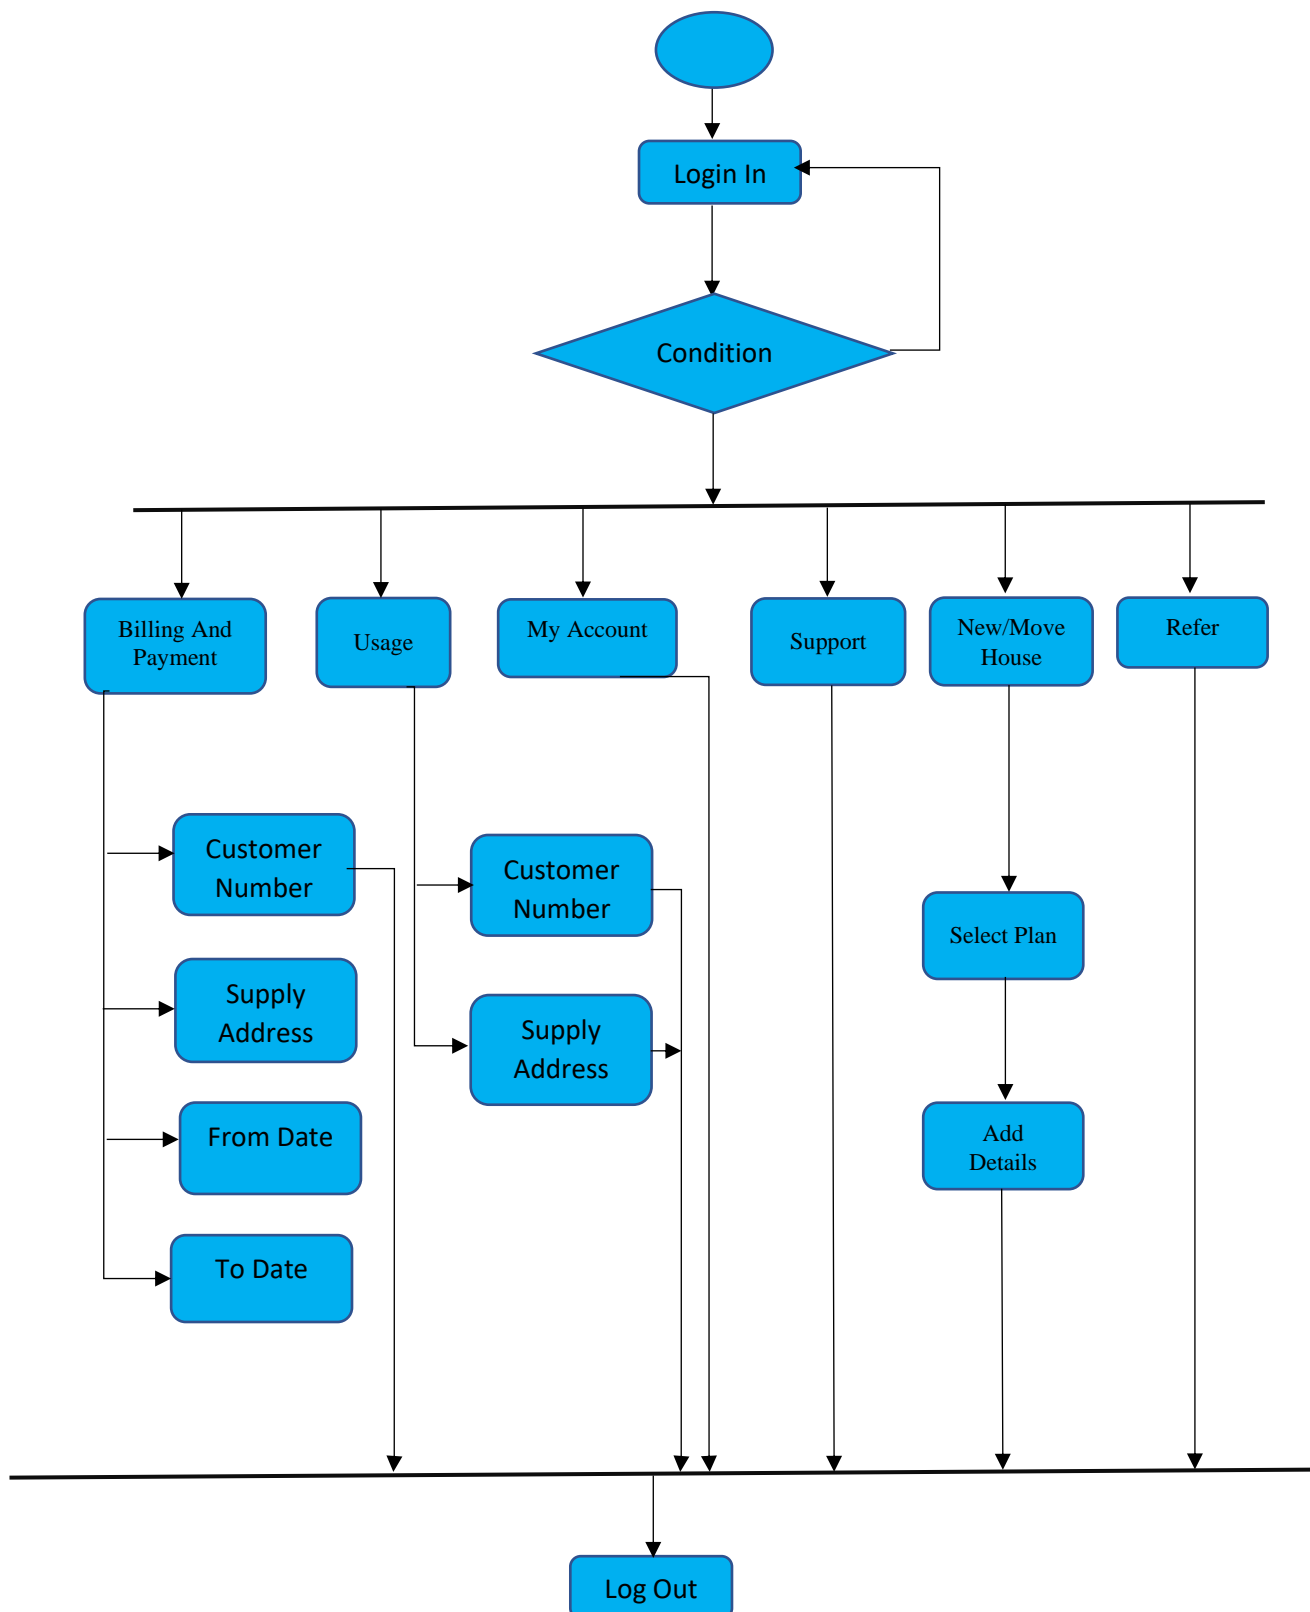

3.4 Activity Diagram

Activity diagrams are graphical representations of workflows of stepwise activities and actions with support for choice, iteration and concurrency. In the Unified Modeling Language, activity diagrams are intended to model both computational and organizational processes (i.e., workflows), as well as the data flows intersecting with the related activities although activity diagrams primarily show the overall flow of control, they can also include elements showing the flow of data between activities through one or more data stores.

Activity Diagram for Admin

Activity Diagram for User

3.5 Data Dictionary

Process Of Customer

| Column Name | Data Type | Constraints |
|-------------------|--------------|-------------|
| Customer ID | Int | Primary key |
| Customer Name | varchar (25) | Null |
| Email Address | varchar (50) | Null |
| NMI | Int | Null |
| Create Date | DateTime | Null |
| Move In Date | DateTime | Null |
| Check Credit | varchar (50) | Null |
| Concession Status | Varchar (50) | Null |
| Channel Name | Varchar (50) | Null |
| Comments | Varchar (50) | Null |
| Is Deleted | Varchar (50) | Null |

Add Channel

| Column Name | Data Type | Constraints |
|-------------------|--------------|-------------|
| Channel ID | Int | Primary key |
| Customer Name | Varchar (50) | Null |
| Channel PartnerID | Varchar (50) | Null |
| Disabled | Varchar (50) | Null |
| Start Date | DateTime | Null |
| End Date | DateTime | Null |
| Action | | |

Add Rate

| Column Name | Data Type | Constraints |
|-----------------|--------------|-------------|
| Network Id | Int | Primary key |
| Customer_Type | Varchar (50) | Null |
| Price Plan Name | Varchar (50) | Null |
| Tariff Code1 | Int | Null |
| Tariff Code2 | Int | Null |

Customer List

| Column Name | Data Type | Constraints |
|-------------------|--------------|-------------|
| Customer ID | Int | Primary key |
| Customer Number | Varchar (10) | Null |
| Email Address | Varchar (50) | Null |
| Customer Name | Varchar (50) | Null |
| Customer Category | Varchar (50) | Null |
| NMI | Int | Null |
| Plan Name | Varchar (50) | Null |
| Create Date | DateTime | Null |
| Move In Date | DateTime | Null |
| Channel Name | Varchar (50) | Null |
| Credit Check | Varchar (50) | Null |
| Concession Check | Varchar (50) | Null |
| Process Notes | Varchar (50) | Null |
| Onboard Status | Varchar (50) | Null |
| Provision Status | Varchar (50) | Null |
| Start Date | DateTime | Null |
| End Date | DateTime | Null |

Transaction List

| Column Name | Data Type | Constraints |
|----------------------|--------------|-------------|
| Transaction ID | Int | Primary key |
| Payment Reference No | Int | Null |
| Statement Number | Int (50) | Null |
| Billed Amount | Int (50) | Null |
| Paid Amount | Int | Null |
| Email | Varchar (50) | Null |
| Created Date | DateTime | Null |
| Start Date | DateTime | Null |
| End Date | DateTime | Null |

Customer Registration

| Column Name | Data Type | Constraints |
|-----------------|--------------|-------------|
| Customer Number | Int | Primary key |
| NMI | Int | Null |
| First Name | Varchar (50) | Null |
| Last Name | Varchar (50) | Null |
| Email Address | Varchar (50) | Null |
| Mobile numbers | Varchar (50) | Null |

Billing And Payment

| Column Name | Data Type | Constraints |
|-------------------|--------------|-------------|
| Supply Address | Varchar (50) | Null |
| Select Start Date | DateTime | Null |
| Select End Date | DateTime | Null |

Usage

| Column Name | Data Type | Constraints |
|-----------------|--------------|-------------|
| Customer Number | Varchar (50) | Null |
| Supply Address | Varchar (50) | Null |

My Account Personal Details

| Column Name | Data Type | Constraints |
|-----------------|--------------|-------------|
| Customer Number | Int | Primary key |
| Contact Type | Int | Null |
| First Name | Varchar (50) | Null |
| Last Name | Varchar (50) | Null |
| Email Address | Varchar (50) | Null |
| Mobile numbers | Varchar (50) | Null |

Authorized Personal Details

| Column Name | Data Type | Constraints |
|--------------------|--------------|-------------|
| Title | Varchar (50) | Primary key |
| First Name | Varchar (50) | Null |
| Last Name | Varchar (50) | Null |
| Phone Number | Int (10) | Null |
| Date Of Birth | DateTime | Null |
| Email | Varchar (50) | Null |
| Contact Adress | Varchar (50) | Null |
| Contact Adress 2 | Varchar (50) | Null |
| City | Varchar (50) | Null |
| Contact State | Varchar (50) | Null |
| Contact Pstal Date | Varchar (50) | Null |

Development

4. Development

Software development is the process of conceiving, specifying, designing, programming, documenting, testing, and bug fixing involved in creating and maintaining applications, frameworks, or other software components. Software development is a process of writing and maintaining the source code, but in a broader sense, it includes all that is involved between the conception of the desired software through to the final manifestation of the software, sometimes in a planned and structured process. Therefore, software development may include research, new development, prototyping, modification, reuse, re-engineering, maintenance, or any other activities that result in software products.

4.1 Coding Standards

Writing an efficient software code requires a thorough knowledge of programming. This knowledge can be implemented by following a coding style which comprises several guidelines that help in writing the software code efficiently and with minimum errors. These guidelines, known as coding guidelines, are used to implement individual programming language constructs, comments, formatting, and so on. These guidelines, if followed, help in preventing errors, controlling the complexity of the program, and increasing the readability and understandability of the program.

A set of comprehensive coding guidelines encompasses all aspects of code development. To ensure that all developers work in a harmonized manner (the source code should reflect a harmonized style as a single developer had written the entire code in one session), the developers should be aware of the coding guidelines before starting a software project. Moreover, coding guidelines should state how to deal with the existing code when the software incorporates it or when maintenance is performed.

Since there are numerous programming languages for writing software codes, each having different features and capabilities, coding style guidelines differ from one language to another? However, there are some basic guidelines which are followed in all programming Languages. These include naming conventions, commenting conventions, and formatting conventions.

4.1.1 ASP.NET

ASP.NET is a web development platform, which provides a programming model, a comprehensive software infrastructure and various services required to build up robust web applications for PC, as well as mobile devices.

ASP.NET works on top of the HTTP protocol, and uses the HTTP commands and policies to set a browser-to-server bilateral communication and cooperation.

ASP.NET is a part of Microsoft .Net platform. ASP.NET applications are compiled codes, written using the extensible and reusable components or objects present in .Net framework. These codes can use the entire hierarchy of classes in .Net framework.

❖ The ASP.NET application codes can be written in any of the following languages:

- C#
- Visual Basic.Net
- HTML (Hyper Text Markup Language)
- Java script
- CSS (Cascading Style Sheets)

ASP.NET is used to produce interactive, data-driven web applications over the internet. It consists of a large number of controls such as text boxes, buttons, and labels for assembling, configuring, and manipulating code to create HTML pages.

❖ ASP.NET Overview

Here are some points that give the quick overview of ASP.NET.

- ASP.NET provides services to allow the creation, deployment, and execution of Web Applications and Web Services
- Like ASP, ASP.NET is a server-side technology
- Web Applications are built using Web Forms. ASP.NET comes with built-in Web Forms controls, which are responsible for generating the user interface. They mirror typical HTML widgets like text boxes or buttons. If these controls do not fit your needs, you are free to create your own user controls.
- Web Forms are designed to make building web-based applications as easy as building Visual Basic applications.

❖ Advantages of ASP.NET

1. Separation of Code from HTML:

To make a clean sweep, with ASP.NET you have the ability to completely separate layout and business logic. This makes it much easier for teams of programmers and designers to collaborate efficiently.

2. Support for compiled languages:

Developer can use VB.NET and access features such as strong typing and object-oriented programming. Using compiled languages also means that ASP.NET pages do not suffer the performance penalties associated with interpreted code. ASP.NET pages are precompiled to **byte-code** and **Just In Time (JIT)** compiled when first requested. Subsequent requests are directed to the fully compiled code, which is cached until the source changes.

3. Use services provided by the .NET Framework:

The .NET Framework provides class libraries that can be used by your application. Some of the key classes help you with input/output, access to operating system services, data access, or even debugging. We will go into more detail on some of them in this module.

4. Graphical Development Environment:

Visual Studio .NET provides a very rich development environment for web developers. You can drag and drop controls and set properties the way you do in Visual Basic 6. And you have full IntelliSense support, not only for your code, but also for HTML and XML.

5. State management:

To refer to the problems mentioned before, ASP.NET provides solutions for session and application state management. State information can, for example, be kept in memory or stored in a database. It can be shared across web farms, and state information can be recovered, even if the server fails or the connection breaks down.

6. Update files while the server is running:

Components of your application can be updated while the server is online and clients are connected. The Framework will use the new files as soon as they are copied to the application. Removed or old files that are still in use are kept in memory until the clients have finished.

7. XML-Based Configuration Files:

Configuration settings in ASP.NET are stored in XML files that you can easily read and edit. You can also easily copy these to another server, along with the other files that comprise your application.

4.1.2 Telerik Rad Controls

Telerik Rad Controls for ASP.NET is the preferred toolset for professional web development. From the most advanced HTML editor and fastest AJAX data grid to SEO-optimized navigation controls, the Telerik products allow you to build highly rich and responsive applications. Customers often recommend Rad Controls for their superior performance, optimized HTML output, comprehensive design-time experience, and native ASP.NET AJAX support. Always hand-in-hand with Microsoft releases, Telerik is traditionally the first component vendor to provide compatibility with emerging browsers, standards and updates of Visual Studio and the .NET Framework.

Telerik controls are supported through a wide range of resources: demos, online documentation, very active forums, Knowledge Base articles, code library, sample applications. Version Q1 2007 include a Manager for Microsoft ASP.NET AJAX. Inspired by the design-time capabilities of Telerik Ajax, the new control will offer completely codeless development experience, but this time with Microsoft ASP.NET AJAX framework. Introduced are also a new set of widgets built on top of ASP.NET AJAX (color-picker, screen tip/tooltip, slider/scroller, spinner, split button, etc.). In addition, new major versions of Rad Input, Rad Chart and Rad Dock are presented.

Advantages:

1. By using this control our lots of coding is reduced. For ex: - Telerik Grid automatically handled Paging, Filter, Sorting...etc. So, we can have reduced development time.
2. Using Telerik style builder, we can easily create our custom theme to match our site theme.
3. Any .NET developer gets good hand on this control in very short time.
4. We can get easily support from Telerik team, Telerik MVP and Telerik users.
5. In trail demo all the features is available, so we can implement this controls in our page and check the how it looks and match our requirement.
6. Demos and documents available in live. If internet is not available in our system, then we can also install this demo in our system and we can check it offline.
7. The number of controls is very high so after buying this controls we do not need to buy any other controls.
8. In-addition its controls also provide client-side events and API.

4.1.3 MS SQL

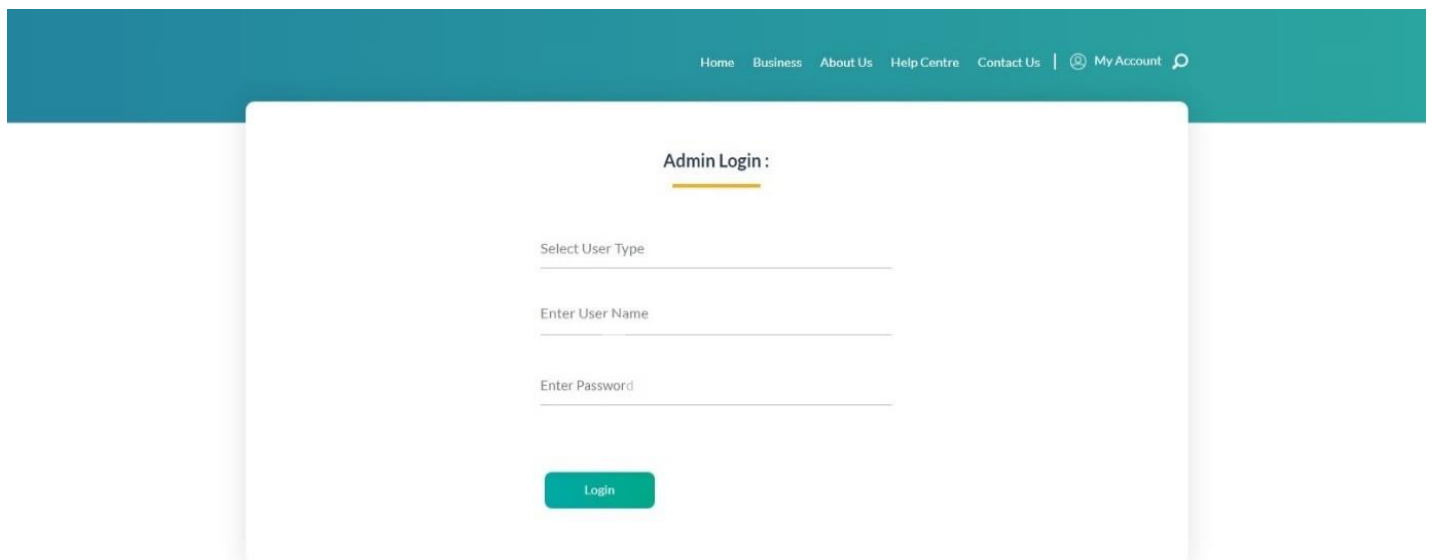

- MS SQL is used for web application because it is designed to scalable and to perform well in multi-user environment.
- It is reliable, platform compatible and easy to use. It provides Excellent Database platform for
 - Large-scale online transaction processing.
 - Data warehousing, and e-commerce Application.
- MS SQL is a database system used on the web.
- MS SQL is a database system that runs on a server.
- MS SQL is ideal for both small and large applications.
- MS SQL is very fast, reliable, and easy to use.
- MS SQL uses standard SQL.
- MS SQL compiles on a number of platforms.
- MS SQL is free to download and use.
- MS SQL is developed, distributed, and supported by Microsoft Corporation.

The data in a MS SQL database are stored in tables. A table is a collection of related data, and it consists of columns and rows.

4.2 Screen Shots

Admin Side

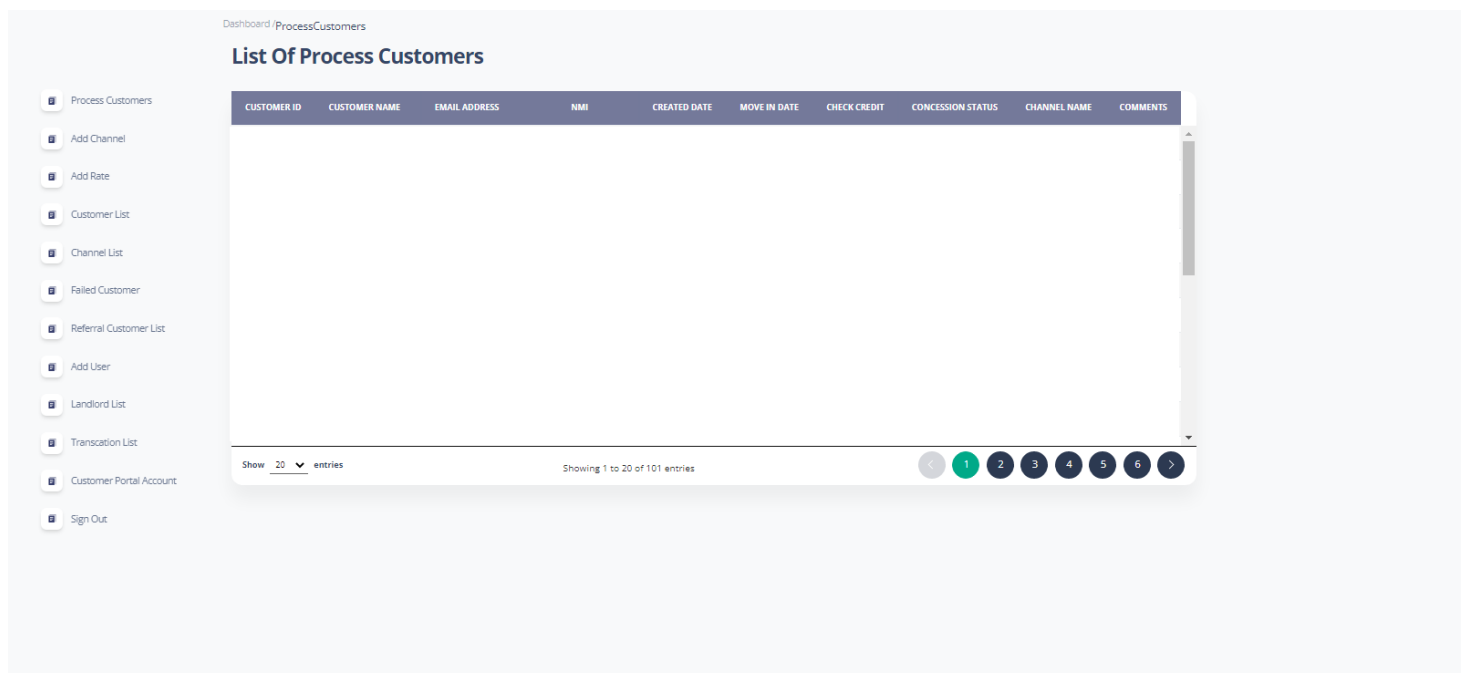

- **Admin Login**

The screenshot shows a web application interface with a teal header bar. The header contains navigation links: Home, Business, About Us, Help Centre, Contact Us, and a user profile icon labeled 'My Account'. Below the header, a white modal box is centered on the page. The modal is titled 'Admin Login :' with a yellow underline. It contains three input fields: 'Select User Type', 'Enter User Name', and 'Enter Password'. At the bottom of the modal is a teal 'Login' button.

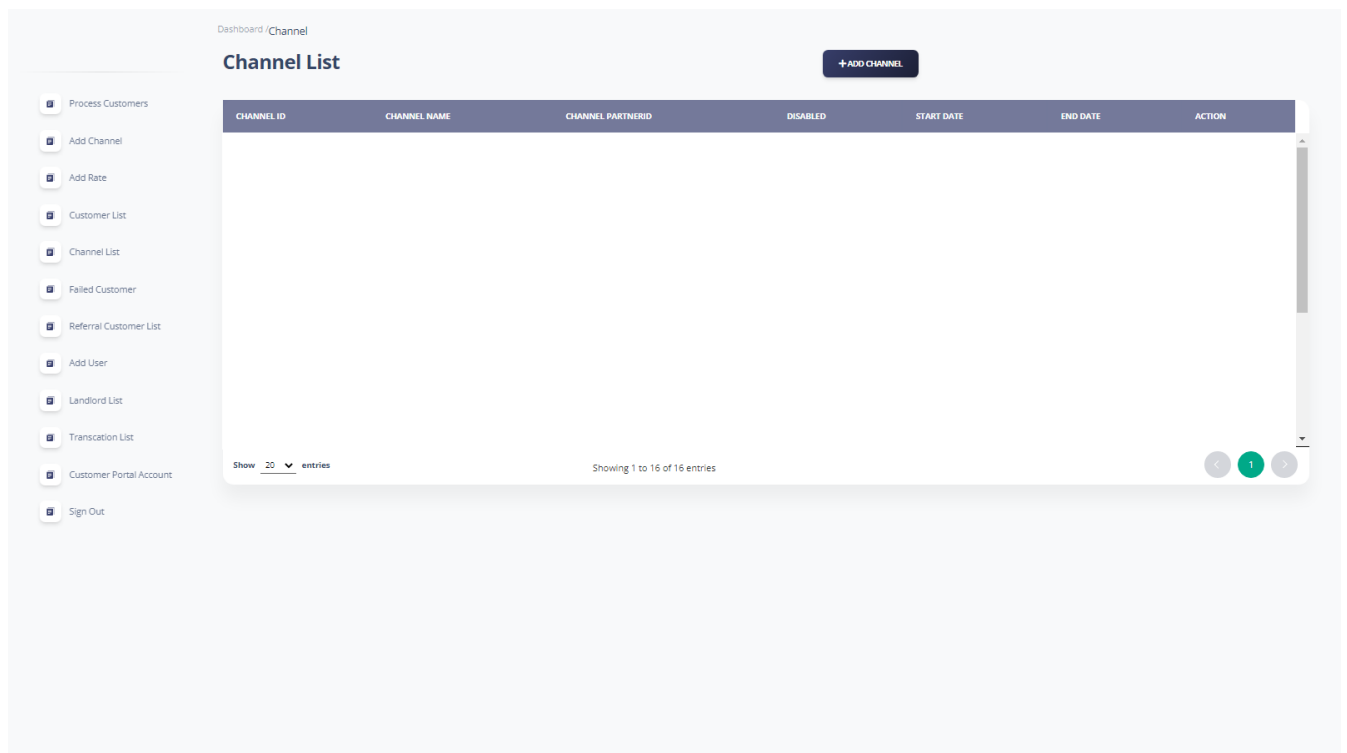

➤ **Admin can login by using this.**

- **List Of Process Customer**

- **This Module shows all the information of Customers to the Admin.**
- **Admin can Add and Update all data in this page.**

- **Channel List**

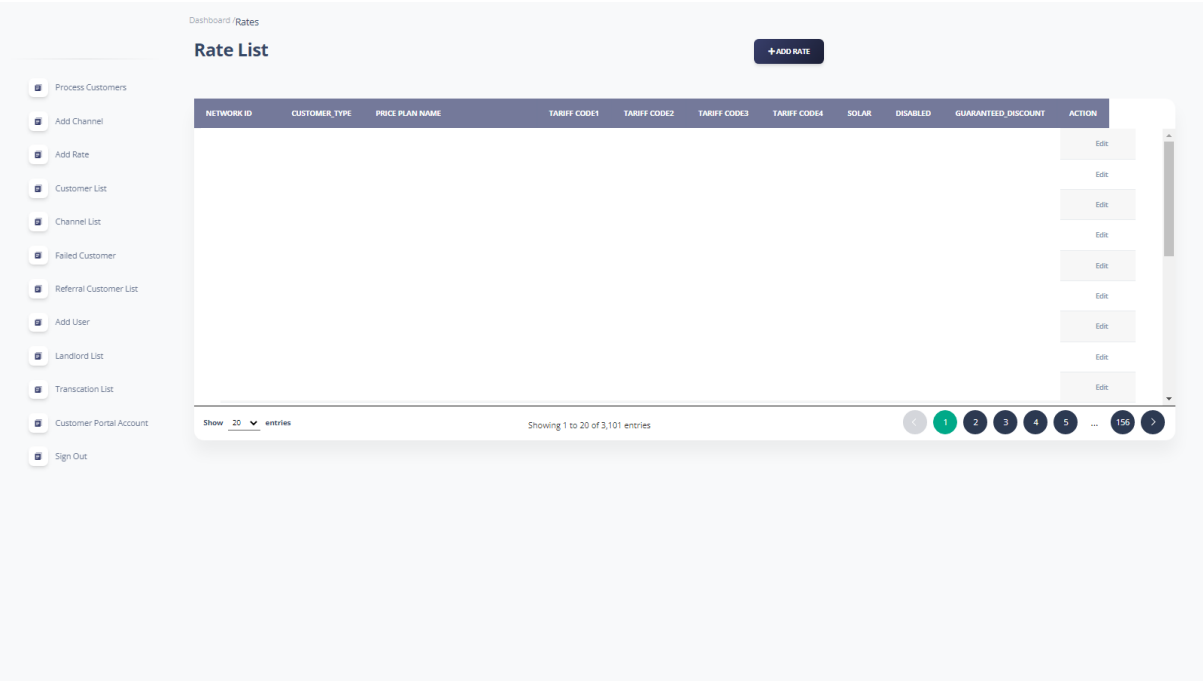

- **This Module shows list of all channels.**
- **Admin can view all the channel list which have user selected.**

- **Add Update Channel**

The screenshot shows a web application interface for managing channels. On the left is a sidebar menu with the following items: Process Customers, Add Channel, Add Rate, Customer List, Channel List, Failed Customer, Referral Customer List, Add User, Landlord List, Transaction List, Customer Portal Account, and Sign Out. The main content area is titled 'Dashboard / Channel' and 'Add Update Channel'. It contains several input fields: 'Channel ID' (placeholder: 'Enter Channel ID'), 'Channel Name' (placeholder: 'Enter Channel Name'), 'Channel Partner ID' (placeholder: 'Enter Channel Partner ID'), 'Start Date', and 'End Date'. Each of these five fields has a red asterisk to its right, indicating they are required. Below the input fields is a 'Disabled' checkbox. At the bottom of the form are two blue buttons: 'SAVE' and 'GO BACK'.

- **Admin can Add and Update any channel by using this Module.**
- **Admin also can remove any channel.**

- **Rate List**

Agile Documentation

5. Agile Documentation

5.1 Agile Project Charter

Project Charter: Electricity Hub

Background (Problem Statement):

Most time the Electricity Provider maintain all customers details and information about their selected plan in records. When the number of records increased, it is difficult to maintain the information of Customers and Connections. Maintaining the records manually leads to error prone and required more man power and it consumes more time for processing the records.

Goals (Objectives):

The system being designed is economically with respect to the Admin and Providers point of view. In **Electricity HUB**, on Dashboard of Admin side, it displays information about Customers Plans, Customer Moving Date, Customer personal details, Customer NMI Number, Customer ID, Customer Selected Channel. Once the connection process is Done and user completely have their connection it will automatically display on Admin's dashboard where Admin can approve the particular services for which users have applied.

Scope:

The design and Implementation of our **HUB** is to provide services to Customers. Admin can bool new plans options where he can fill the details of customers according to customer's requirement and add prices or plans. All data is stored securely on SQL server and managed by Admin. Admin will able to add details like customer's information which is used to make new connection and move their current or old connections to new space.

Key Stakeholders

5.3 Agile Project Plan

Project Name: Electricity Hub

Project Manager: Mayur Shah

Project Deliverable: Web Application

Scope Statement:

We have three actors on our **Electricity Hub** i.e., Admin and Customers. Customers can select their plans by their need. The admin will provide the services to the customers. So, this application will be treated as a bridge between the Customer and the Admin. Admin will manage the Customers which are registered in our Hub. All data is stored securely on SQL server and managed by Super Admin. When the customer is making new connection, the admin will get the notification related to their selected plans.

Start Date: 30-March-2023

End Date: 01-May-2023

Overall Progress: 95%

5.7 Agile Test Plan

Project Name: Electricity Hub

Written By: Abhishek Tripathi, Harsh Roy, Vaidik Kanani

Tested By: Abhishek Tripathi, Harsh Roy, Vaidik Kanani

Browser: Google Chrome/Fire fox/MS Edge

Version: Visual studio 2019

Tested On: 02-June-23

Description:

The system is developed for electricity service to the customer. It maintains the customer with what plans they should go with as per their power usage. This is for both residential and commercial. This is an overseas client, we have two actors on portal i.e., User and Admin. The web application using Asp.NET 4.5 SQL Server 2019, Bootstrap, Kendo Controls, JavaScript and jQuery.

Admin Side:

| Test # | Date | Action | Expected Results | Actual Results | Pass? |
|--------|---------------|-------------------------|---|------------------------|-------|
| 1 | 31-March-23 | Process customer | Showing List of Customers. | Completed Successfully | Yes |
| 2 | 05-April-2023 | Add Channel | Add, Listing, Update, Delete Channels | Completed Successfully | Yes |
| 3 | 08-April-23 | Add Rate | Add, Listing, Update, Delete Rates | Completed Successfully | Yes |

Proposed Enhancement

6 Proposed Enhancement

In Today's world moving to the online application so we initiate this project for the Electricity hub to make electricity services faster and low time consumer by using this Application. This system is useful for the Customers who have no time in this conflictual life. This Application will save the precious time of our customers and provide them service's which they need at their door steps.

Conclusion

7 Conclusion

It concludes that this system is user-friendly and easy to use. We can say that any Civilian can use this system for get their electricity connection and if they already have connection than they can easily move their connection to another new place by sitting at their house. Our application is mainly developed to help today's generation.
